WHY IS IT SO DIFFICULT TO QUANTIFY THE SOCIETAL IMPACT OF FOODBORNE DISEASES?

- **Many hazards**
 - Viruses, bacteria, parasites, chemicals, toxins,
- **Many health outcomes**
 - Acute intoxication, diarrhea, birth defects, epilepsy, cancer,
- **Many incubation times**
 - Hours – decades
- **Many cases unrecognized**
 - No medical contact, weak surveillance systems
- **Many transmission pathways for most foodborne hazards**
 - Food, water, human-human, animal-human, environment

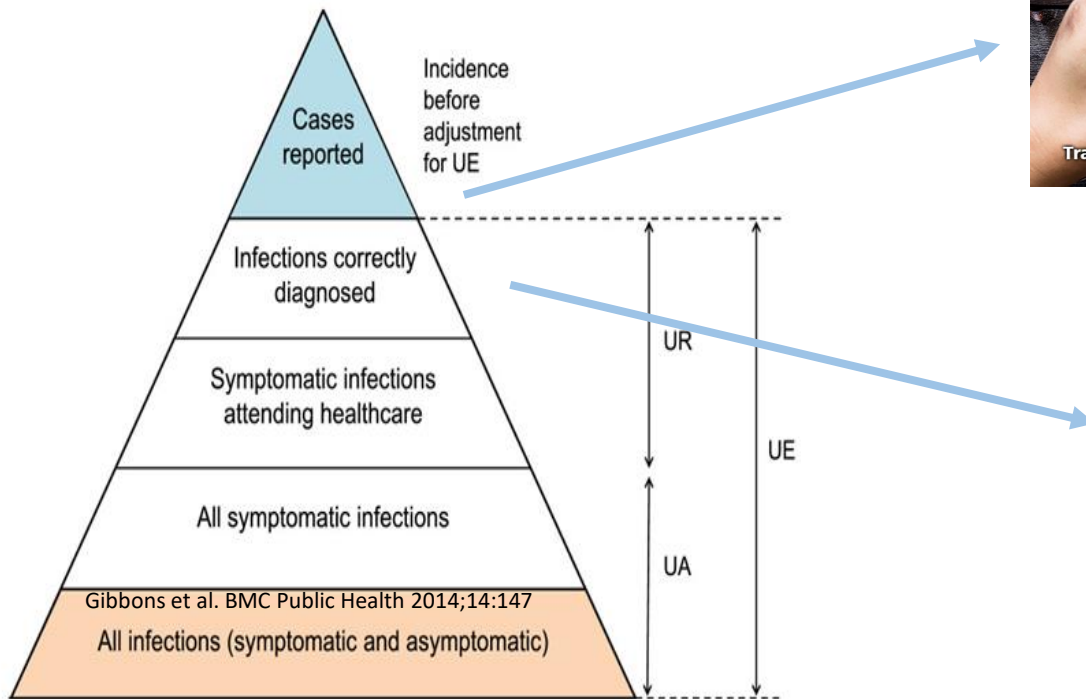

FULLY QUANTIFYING THE BURDEN OF FOODBORNE DISEASE IS VIRTUALLY IMPOSSIBLE BUT MEANINGFUL CHOICES CAN BE MADE

DOMAINS FOR INDICATORS OF FOODBORNE DISEASE

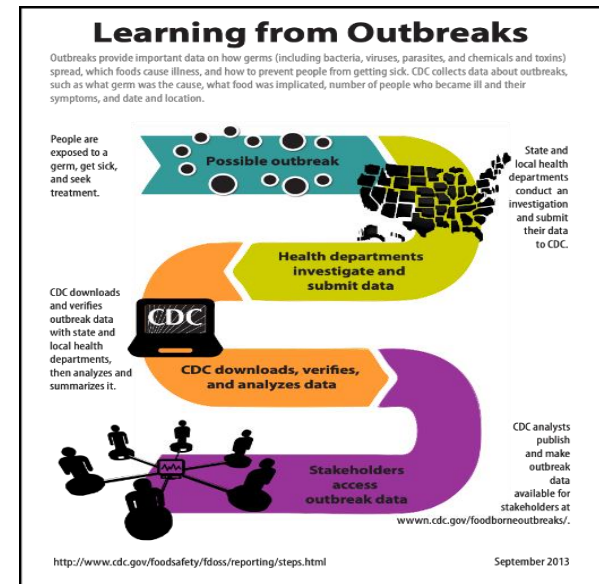

- **Health**
 - Incidence, mortality, summary measures of public health, ...
- **Economics**
 - Cost-of-illness, regulatory costs, compliance costs, ...
- **Hazard occurrence in food chains**
 - Regulatory inspections, randomized surveys, ...
- **Food systems inspections**
 - Regulatory, voluntary,
- **Value chain actor behavior**
 - Stated, observed, ...

INTERNATIONAL COMPARABILITY IS A MAJOR CHALLENGE

SURVEILLANCE OF FOODBORNE DISEASES

Gibbons et al. BMC Public Health 2014;14:147

CHALLENGES FOR FOODBORNE DISEASE SURVEILLANCE

- **Dependent on decisions made in healthcare systems (“eavesdropping”)**
 - Not consistent between countries, regions or smaller geographical systems
 - Practices change over time (e.g. non-culture dependent diagnostics)
 - Budget limitations
 - Incomplete
- **Timeliness**
 - Recall bias
 - Food samples no longer available

ESTIMATING THE BURDEN OF FOODBORNE DISEASE REQUIRES SYNTHESIS OF MANY DIFFERENT DATA SOURCES AND (STATISTICAL) IMPUTATION OF MISSING DATA

BURDEN OF FOODBORNE DISEASE

- Illnesses, deaths
- Disability-Adjusted Life Years (DALYs)
 - 1 DALY = 1 healthy life year lost
 - Summary measure of population health
 - Morbidity + mortality
 - Disease occurrence + disease severity
 - DALY = YLD + YLL
 - YLD = Years Lived with Disability
= Number of incident cases (N) × Duration (D) × Disability Weight (DW)
 - YLL = Years of Life Lost
= Number of deaths (M) × Residual Life Expectancy (RLE)
 - Document current and future burden (sequelae, chronic exposures)

DISABILITY-ADJUSTED LIFE YEARS

$$10 + 30 = 40 \text{ DALYs}$$

$$\text{DALY} = \text{YLD} + \text{YLL}$$

- YLD = Years Lived with Disability = $N \times D \times DW$
- YLL = Years of Life Lost = $M \times RLE$

WHO ESTIMATES OF GLOBAL BURDEN OF FOODBORNE DISEASE

- Global estimates for 31 hazards published in 2015
 - 11 acute diarrheal disease, 7 invasive infectious disease, 10 helminths, 3 chemicals
- Estimates for high-income countries for 4 hazards
 - 4 bacterial toxins; 1 allergen
- Estimates for 4 metals published in 2019
 - Methodological differences

FOODBORNE DISEASES ARE A GLOBAL PUBLIC HEALTH PROBLEM

- **WHO Foodborne Disease Burden Epidemiology Reference Group (FERG) 2015**
 - 31 hazards
 - 600 million illnesses, 420,000 deaths, 33 million DALYs
- **FERG 2019**
 - 4 metals
 - 1.1 million cases, 56,000 death, 9 million DALYs
- **Many more hazards and outcomes are potentially important, but not currently quantifiable**
- **WHO is developing a strategy to update estimates by 2025 and develop a food safety indicator (World Health Assembly resolution EB146.R9)**

<https://collections.plos.org/ferg2015>

GLOBAL BURDEN OF FOODBORNE DISEASE

Hazard group	Foodborne illnesses (millions)	Foodborne deaths (thousands)	Foodborne DALYs (millions)
2015 estimates			
All	600	420	33
Diarrheal	549	230	18
Invasive	36	117	8
Helminths	13	45	6
Chemicals	0.2	19	0.9
2019 estimates*			
Chemicals	1.1	56	9.2

*Different estimation methods

Havelaar et al., PLOS Med 2015;12:e1001923
Gibb et al., Env Res 2019;174:188-194

FOODBORNE DISEASES ARE UNEQUALLY DISTRIBUTED

- Children under five years of age
 - ... make up 9% of the world population
 - ... suffer from 38% of all foodborne illnesses
 - ... succumb to 30% of foodborne deaths
 - ... bear 40% of global foodborne DALYs

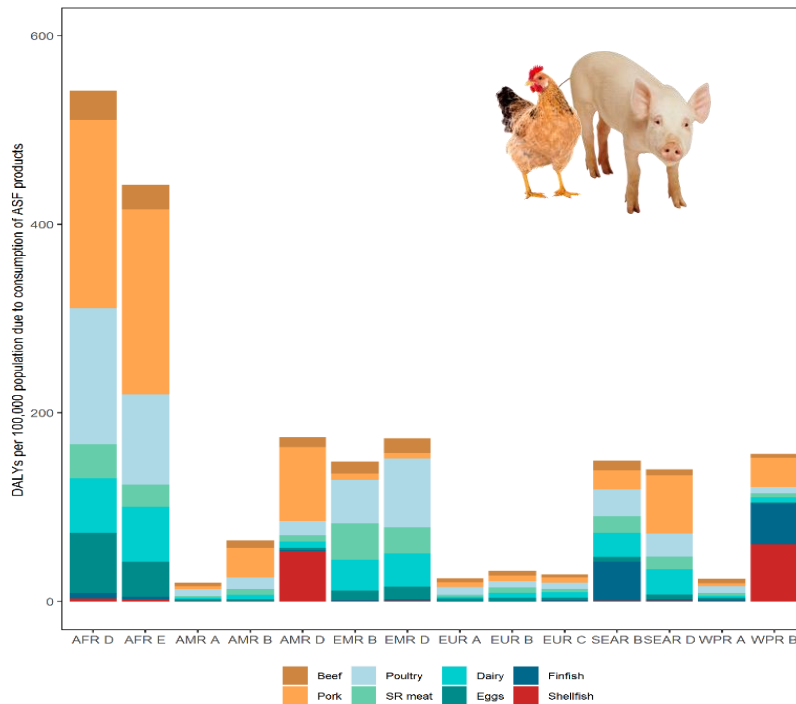

- People living in the poorest areas of the world
 - ... make up 41% of the world population
 - ... suffer from 53% of all foodborne illnesses
 - ... succumb to 75% of foodborne deaths
 - ... bear 72% of global foodborne DALYs

Havelaar et al., PLOS Med 2015;12:e1001923
 Gibb et al., Env Res 2019;174:188-194

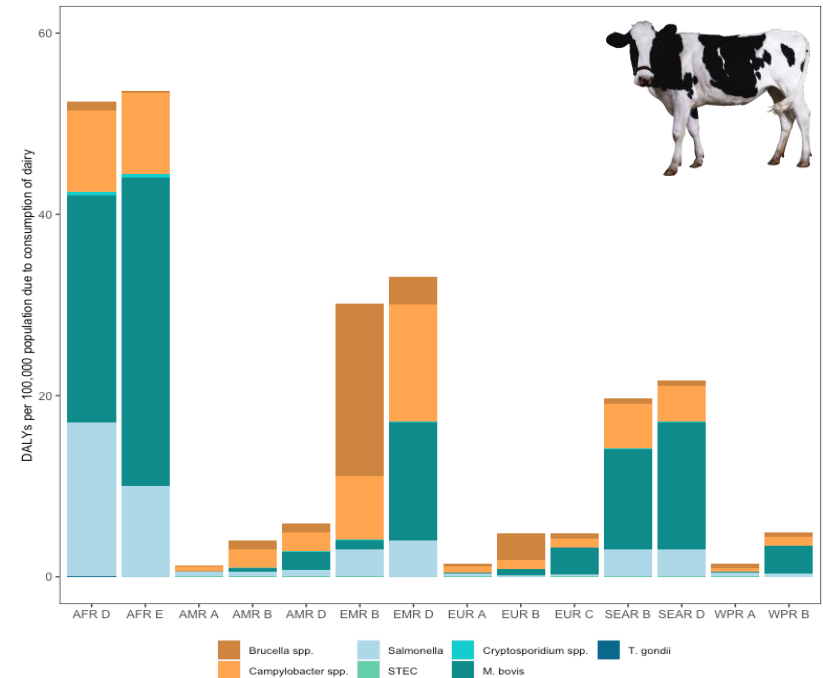

ZOOMING IN ON THE BURDEN OF SPECIFIC FOODS

Animal source foods contribute 35% of the burden of foodborne disease

Li et al., PLOS One 2019;14:e0216545

Dairy products contribute 12% of the burden of animal source foods

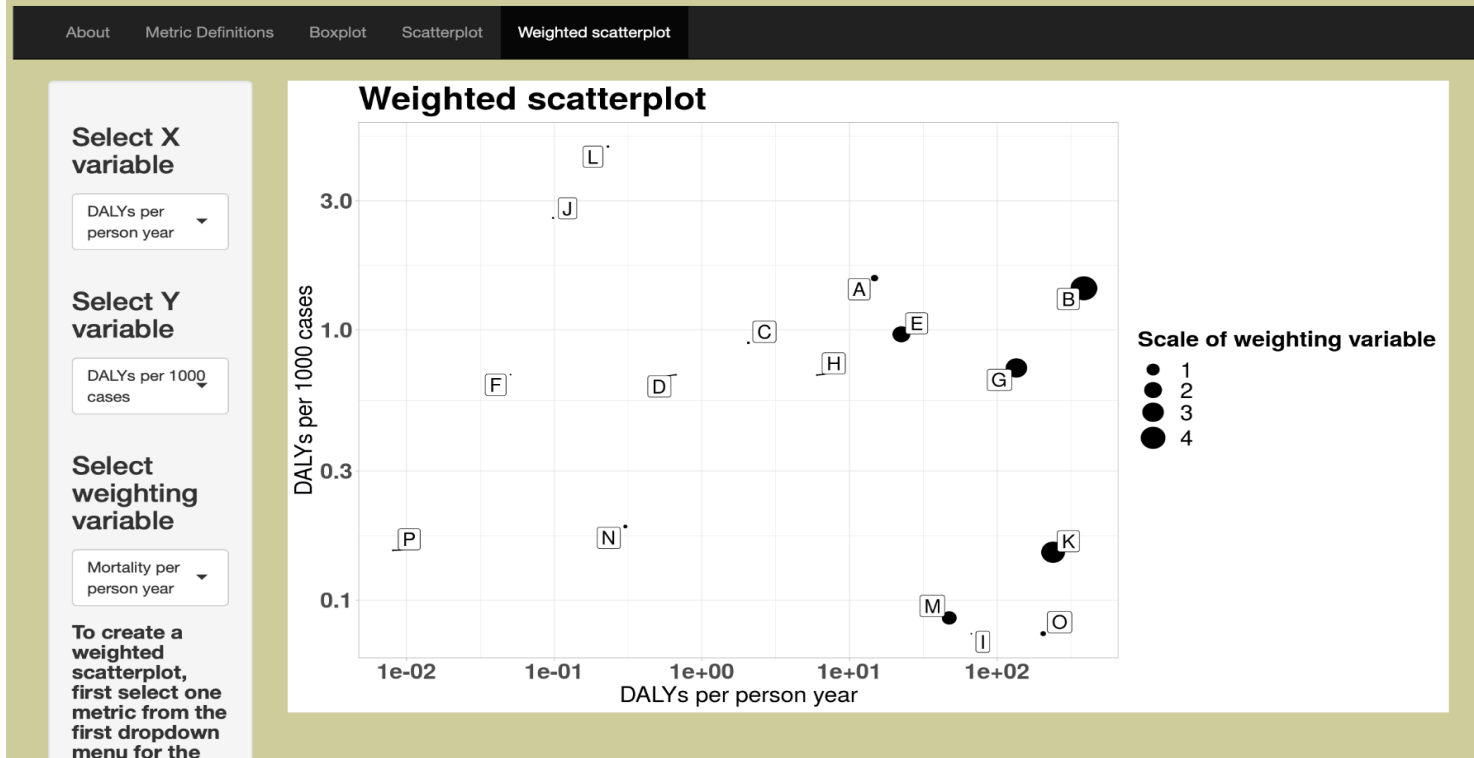

Grace et al., J Dairy Sci, accepted

FOOD SAFETY DECISION MAKING

- **FERG estimates have been influential in raising global awareness of food safety as a public health problem**
 - Food Safety Day – June 7
 - If it isn't safe, it isn't food
- **Food safety decision making is the responsibility of national governments**
 - FERG estimates published at subregional level
 - Country-level estimates are available but need national clearance
 - National priorities may not be fully represented in global estimates
 - National decision makers need training in risk-based decision making

DATA DASHBOARD FOR ETHIOPIA

Estimates of Public Health Impact from Foodborne Disease in Ethiopia

Dashboard populated with hypothetical data for training purposes

LIMITATIONS OF FERG ESTIMATES

- Data availability and quality
 - Particularly in low-income countries where burden is highest
 - Imputation and expert judgment
 - Presentation at regional level rather than country level
 - Large uncertainty intervals
- Underestimation
 - Limited number of hazards
 - Not all endpoints considered, e.g. **malnutrition and stunting**, irritable bowel syndrome, chronic (psychiatric) consequences of toxoplasmosis
 - Burden in HIV-positives preventable by food safety interventions
 - Model uncertainty, e.g. multiplicative or additive models for chemicals
 - Public health metrics do not quantify the full societal impact of foodborne diseases, e.g. economic burden
 - Indirect transmission of disease agents from food production systems – One Health

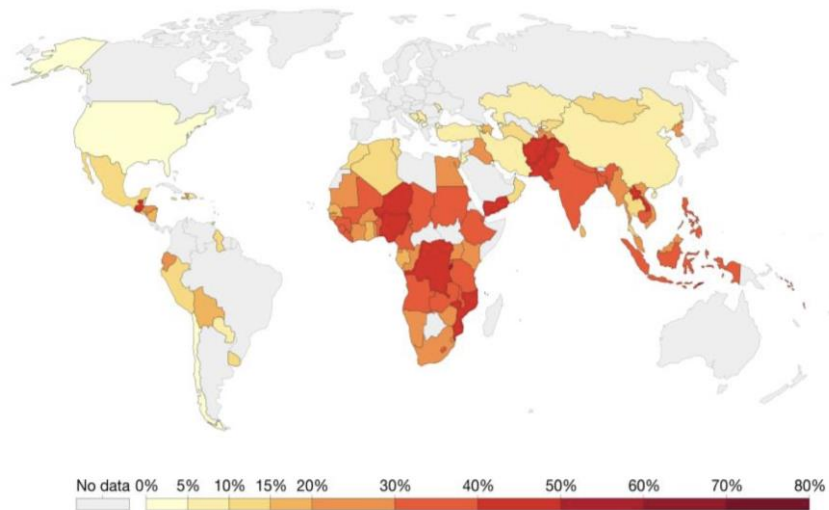

STUNTING

- Affects 25% of children globally, 35% in Africa, 38% in Ethiopia
- Stunting is associated with:
 - Increased mortality from diarrhea, pneumonia, other infectious diseases
 - Impaired cognitive development
 - Reduced income
 - Reduced life expectancy
 - Increased risk of chronic diseases later in life
- Need for interventions to reduce this important cause of morbidity and mortality

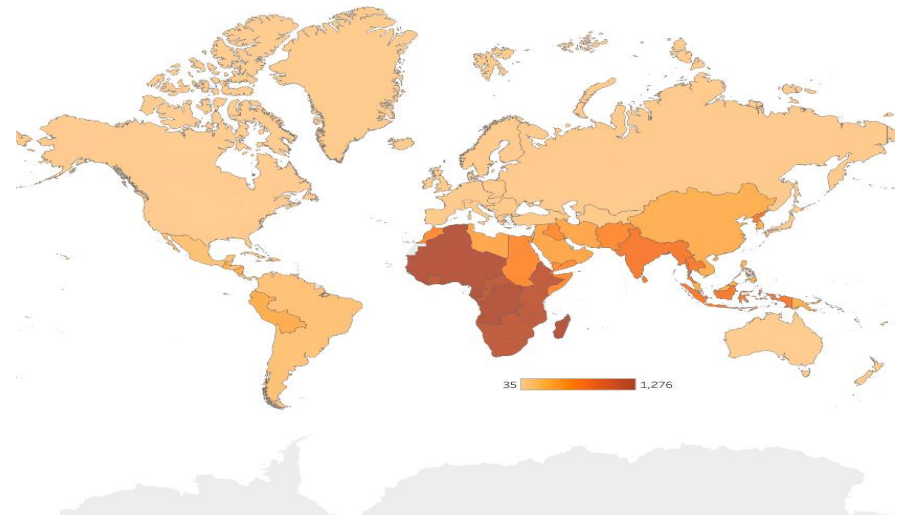

JUXTAPOSITION OF NUTRITION AND FOOD SAFETY IMPACTS

Global distribution of stunting Global distribution of foodborne disease

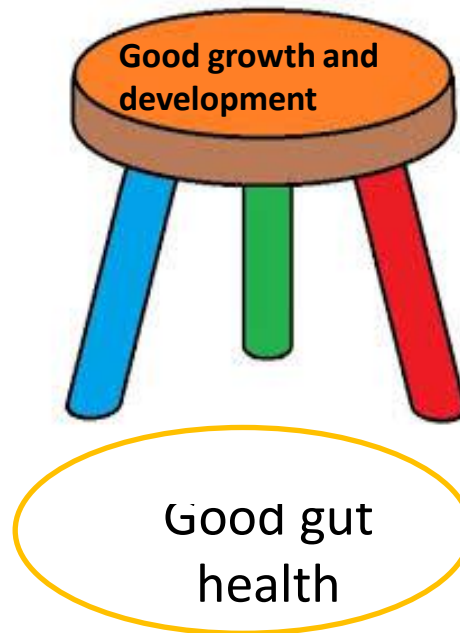

Source: GAIN

Source: WHO, Adam Ragusea

3 CONDITIONS FOR NORMAL GROWTH AND DEVELOPMENT

No excess of symptomatic common infections such as malaria, diarrhea, or lower respiratory tract infections

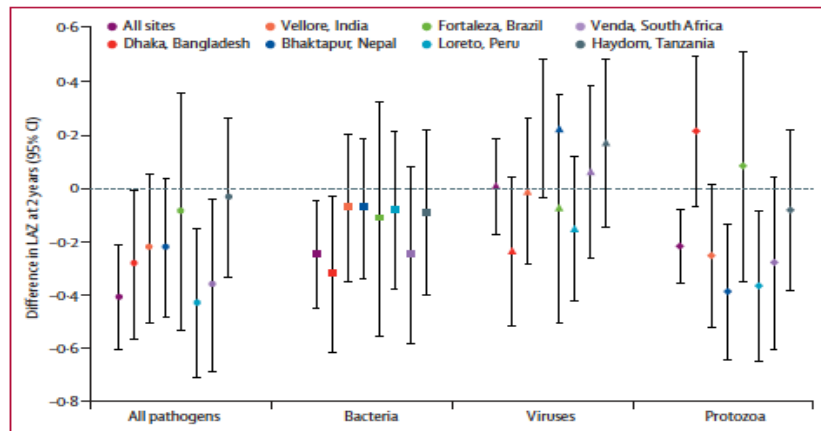

Diet provides adequate macro- and micronutrients in bioavailable forms

Dr. Mark Manary
Washington University, St Louis

FOODBORNE DISEASE AND MALNUTRITION

- Enteric (bacterial) infections and mycotoxins are increasingly associated with stunting
 - Environmental enteric dysfunction
 - Foodborne transmission important for many identified hazards

Rogawski et al., Lancet Glob Health 2018;e1319-e28

Trehan et al., Arch Dis Child 2016;101:741-4

CAMPYLOBACTER SPECIES ARE ASSOCIATED WITH LINEAR GROWTH FILTERING AND INFLAMMATION IN LMIC

Prevalence of *Campylobacter jejuni/coli* by quantitative PCR

Prevalence of *Campylobacter* species by enzyme immunoassay

Outcome	<i>C. jejuni / coli</i>	<i>Campylobacter</i> spp.
ΔHAZ	-0.18 (-0.30, -0.06)	-0.31 (-0.46, -0.15)
Fecal MPO	0.29 (0.24, 0.34)	0.20 (0.16, 0.24)

- Livestock (poultry, ruminants, pigs) are main reservoirs of *C. jejuni / coli*
- Reservoirs of other *Campylobacter* species are less well known; mammals most frequently reported
- Very few data from LMIC
- Quantification of reservoirs and transmission pathways is critical to define interventions

CONCLUSIONS

- The global burden of unsafe foods is substantial
- A large share of the burden is borne by children under five years of age and those living in low-and middle-income countries
- Priority hazards differ between regions
- Nutrient-dense foods are more likely to cause foodborne disease than staple foods
- Emerging evidence links foodborne enteric pathogens to poor gut health and stunting
- Control methods do exist for many hazards, and are linked to economic development and effective food safety systems
- Developing a consistent set of food safety indicators requires international collaboration
